Short window: constant displacement cancels

$$z_k = z_k^0 + b, \quad z_{k-5} = z_{k-5}^0 + b$$

$$(z_k - z_{k-5}) - (a_k - a_{k-5})$$

No added information about constant b
when both rows share it; gap resets history.

Historical anchor: span the outage

$$\hat{z}_k = z_a + (a_k - a_a), \quad e_k^A = z_k - \hat{z}_k$$

Past admitted raw GNSS / LIO

Admission veto

Anchor is a decision memory, never another measurement.
Only current original GNSS updates the position KF once.
